

McAfee Integrity Monitoring for Databases

Quickly evaluate and monitor the state of database security

Key Advantages

- Entry-level solution specifically tailored for PCI and SOX compliance
- Integrated testing and monitoring improves visibility into database security posture
- Minimizes risk and liability with real-time notification of any changes to configurations that impact security
- Saves time and money with fast, easy deployment
- Supports the most widely-deployed systems running in the data center or in the cloud
- Integrates with core McAfee products such as McAfee ePolicy Orchestrator® (McAfee ePO™) software and McAfee Vulnerability Manager for Databases

Compliance regulations demand that organizations have proper controls over sensitive data, including financial information and personally identifiable information (PII) for customers. This information is typically stored in relational databases, but complex configuration of these systems and difficulty in monitoring privileged access make it a challenge to demonstrate consistent protection. McAfee® Integrity Monitoring for Databases tests systems for common configuration vulnerabilities, monitors changes to these settings, and helps you build a custom security policy to audit access to your sensitive data, providing visibility into potentially dangerous configuration changes and making it easier demonstrate compliance to auditors.

With McAfee Integrity Monitoring for Databases, organizations gain visibility into important configuration parameters for database servers, as well as any changes to these settings that could impact data security. This helps enterprises obtain the necessary information to meet compliance requirements.

McAfee Integrity Monitoring for Databases is the easiest, most cost-effective solution to deploy for evaluating and monitoring the security of systems storing sensitive information. It can be up and running quickly, without impacting existing operations or performance, and offers a simple upgrade path to more advanced capabilities as needed.

Enhanced Visibility to Help You Meet Compliance Requirements

McAfee Integrity Monitoring for Databases delivers a core set of features and functionality for testing database configuration, monitoring important changes that could affect security, and generating reports on these systems to meet audit requirements. With McAfee Integrity Monitoring for Databases, organizations can:

- Gain visibility into the current security state of database servers and be notified of all events that could introduce new risks

- Monitor access to specific sensitive tables, even by privileged users, without requiring native audit
- Easily generate reports demonstrating proper controls over database security
- Maintain separation of duties as required by many regulations

Checks Configuration and Monitors Changes Impacting Security

McAfee Integrity Monitoring for Databases assesses the underlying security of your databases and generates a trusted audit log for configuration changes that could impact security. Detailed records track creation of administrative users, changes to privileges or permissions, and modifications to any audit settings, including exactly who made the change, when, and from what system.

Deploy Quickly and Non-Intrusively with Minimal Resources

McAfee Integrity Monitoring for Databases can be installed and configured in under an hour, without any changes to your database systems, and immediately begins testing and monitoring database servers. It securely records all access to selected tables without requiring native audit on the database, creating minimal load on the server.

Flexible Reporting with McAfee ePolicy Orchestrator

McAfee Integrity Monitoring for Databases is integrated with the McAfee ePO dashboard for centralized reporting and summary information for up to thousands of databases from a common interface.

Next Steps

Get started today by downloading a 30-day trial of McAfee Integrity Monitoring for Databases at www.mcafee.com/producttrials.
