

# McAfee Vulnerability Assessment SaaS

Helping you secure and measure your network perimeter against daily threats

Network perimeter and website breaches are increasing common, leading to devastating consequences for companies with online operations—loss of customer trust, decreased revenue, downtime, and legal repercussions. In fact, over 70% of websites are vulnerable to hackers. McAfee Vulnerability Assessment SaaS' accurate vulnerability scanning and reporting technology identifies the presence of security holes, including dangerous web application risks, and then provides the information you need to prioritize and rapidly address risks across business units and IT groups.

## Key Advantages

- Provides comprehensive overview of vulnerability risk exposure
- Automatic prioritization of security risks
- Provides objectivity in planning remediation activities
- No hardware or software to install or maintain. It's all done online.
- Customizable configurations based on your daily needs
- Ability to map network perimeter
- Checks for latest web application and network perimeter vulnerabilities
- McAfee Technical Assist: unlimited technical and compliance support (available 7am-7pm PST)
- All the benefits of McAfee PCI Certification Service

## A Smart, and Simple Solution to Network Perimeter Vulnerabilities

We've integrated complementary security technologies into a single service that helps protect your network perimeter, your organization, your brand, and your customers from hackers. The core of our service is the same McAfee vulnerability scanning technology that currently protects more than 80,000 websites around the world. We combine it with continuously updated security data obtained from technology that searches and identifies sites that are knowingly or unwittingly enabling cybercrime. This technology browses sites, downloads files, and tests signup forms to uncover malicious activity, such as spyware infections, identity theft scams, and spamming.

## Defining Your Security Path

When we find security risks, we won't just give you a 100-page report. We give you the information in an understandable, actionable and prioritized format so you can remediate risks according to your risk tolerance. You'll be able to quickly and efficiently delegate tasks across business units or among IT personnel, including contractors or consultants. After you remediate some (or all) of the risks, we'll even tell you where you stand.

## Objectivity through Benchmarking

Transparent objectivity is central to McAfee Vulnerability Assessment SaaS offering. As your network evolves and changes, you will be able to continually benchmark your real-time network perimeter security status against recognized third-party security standards including McAfee SECURE and PCI. You'll know where you stand every day.

## Knowing What to Do Next

On its own or as part of an integrated data security program, McAfee Vulnerability Assessment SaaS eliminates confusion and questions such as "what should we do next?" With fewer false positives, and comprehensive technical support from certified data security professionals, you'll know exactly what to address first, and have expert assistance should you need it.

## Saving Time and Money with SaaS

McAfee Vulnerability Assessment SaaS is completely web-based (Software-as-a-Service) and runs entirely from our network. It requires no installation, no setup, no hardware purchases, no software development, no security expertise, and no special training to use. McAfee's interactive, highly customizable vulnerability management portal is accessible through any browser.

**Achieving Compliance and Benefitting From It** McAfee is also certified by the Payment Card Industry Standards Council as an Approved Scanning Vendor. If you need to validate compliance with the PCI standard, McAfee Vulnerability Assessment SaaS includes a simplified, easy-to-use system perfectly suited to any organization that needs to successfully and confidently complete the steps necessary for Merchant Level 2-4 PCI certification.

Compliance also holds other benefits. If your website is transactional, you can increase site conversion by using McAfee Vulnerability Assessment SaaS and complying with the McAfee SECURE data security standard to promote your certified security to customers, suppliers and consumers through public display of the McAfee SECURE trustmark. It is just one more benefit of operating a safer and certified website.
